Final remarks

Detectability of certain dark-matter candidates

Mark W. Goodman and Edward Witten

Joseph Henry Laboratories, Princeton University, Princeton, New Jersey 08544

(Received 7 January 1985)

We consider the possibility that the neutral-current neutrino detector recently proposed by Drukier and Stodolsky could be used to detect some possible candidates for the dark matter in galactic halos. This may be feasible if the galactic halos are made of particles with coherent weak interactions and masses $1-10^9$ GeV; particles with spin-dependent interactions of typical weak strength and masses $1-10^2$ GeV; or strongly interacting particles of masses $1-10^{13}$ GeV.

L. Baudis, 2012

$$E_R \approx m_\chi v_0^2 \frac{m_\chi m_N}{(m_\chi + m_N)^2}$$

$$m_\chi \in [1, 10^3] \text{ GeV}$$

$$E_R \in [1, 10^2] \text{ keV}$$

Final remarks

Some experiments (limits)

Darkside-50

Laboratorio Nazionale del Gran Sasso

Material target: Argon

Detector mass: 50 kg

90%CL L: $\sigma \lesssim 10^{-44} \text{ cm}^2$ $m_{\text{DM}} = 100 \text{ GeV}$

PANDA-XII

China Jinping Underground Laboratory

Material target: Xenon

Detector mass: 500 kg

90%CL L: $\sigma \lesssim 10^{-46} \text{ cm}^2$ $m_{\text{DM}} = 40 \text{ GeV}$

XENON-1T

Laboratorio Nazionale del Gran Sasso

Material target: Xenon

Detector mass: ~2ton

90%CL L: $\sigma \lesssim 7.7 \cdot 10^{-47} \text{ cm}^2$ $m_{\text{DM}} = 30 \text{ GeV}$

Beyond "standard" WIMPs

Final remarks

Mimicking WIMPS

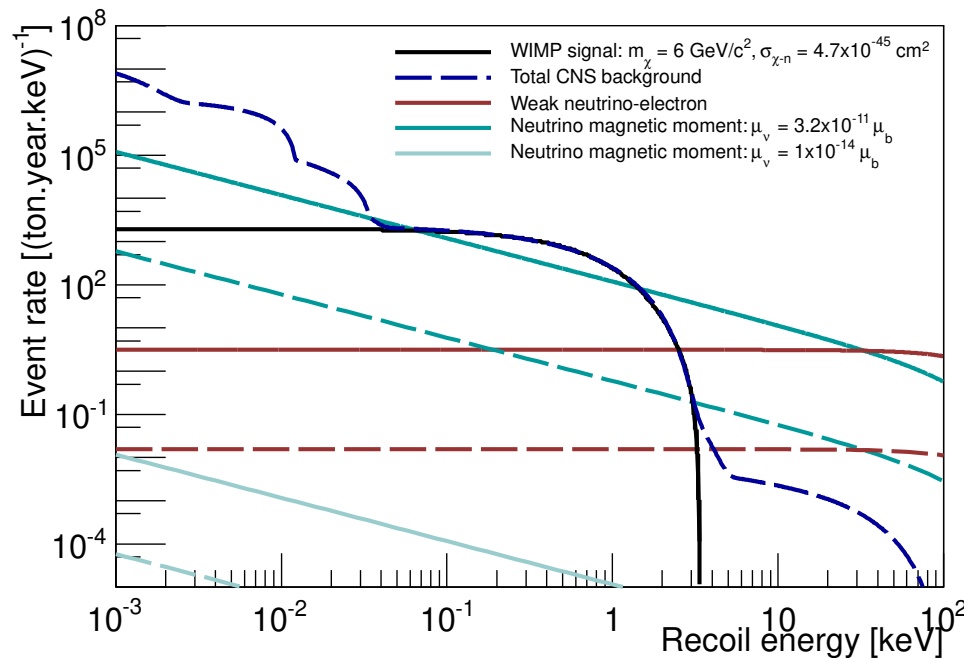

With sufficient neutrino events a WIMP-like signal can be mimicked

ν 's act as glitter: They shine as gold but aren't

Unmask the "impostor"

⇒ Calculate dR_{WIMP}/dE_R as a function of E_R

⇒ Compare χ and ν recoil spectra ⇒ Best match gives the "impostor" mask

Solar ν

$$m_\chi = 6 \text{ GeV and } \sigma_{\chi-N} \approx 4.4 \times 10^{-45} \text{ cm}^2$$

Atmospheric ν

$$m_\chi = 100 \text{ GeV and } \sigma_{\chi-N} \approx 10^{-48} \text{ cm}^2$$

Dark matter direct detection and neutrinos

- Constructing the ν floor
- The result
- Sensitivity and new physics

Beyond "standard" WIMPs

Final remarks

Constructing the ν floor

Billard, Figueroa, Strigari, 2013

Goal: Determine the best background-free sensitivity achievable at each WIMP mass for an exposure of one neutrino event

Sensitivity

$$\sigma_{\chi-n} = \frac{R_{\chi}}{\mathcal{E}(E_R^{\text{th}}) \int_{E_R^{\text{th}}}^{E_R^{\text{max}}} dR_{\chi}/dE_R|_{\sigma_{\chi-n}=1} dE_R}$$

Exposure

$$\mathcal{E}(E_R^{\text{th}}) = \frac{\# \text{ neutrino events}}{\int_{E_R^{\text{th}}} dR_{\nu}/dE_R dE_R}$$

Strategy

- Fix target (**Xe**), calculate sensitivities in $E_R^{\text{th}} = [10^{-2}, 10^2]$ keV. Fix $R_{\chi} = 2.3$ (90% CL)
- Optimize the calculation so each isocontour involves a **single neutrino**:
 - ✓ Small $E_R \Rightarrow$ Large Φ_{ν} (\mathcal{E} small) \Rightarrow Large $\sigma_{\chi-n}$ for small m_{χ}
 - ✓ Large $E_R \Rightarrow$ Small Φ_{ν} (\mathcal{E} large) \Rightarrow small $\sigma_{\chi-n}$ for large m_{χ}
- For each sensitivity isocontour (each E_R^{th}) select $\{m_{\chi}, \sigma_{\chi-N}|_{\min}\}$, fit the points and *voilà*

Dark matter direct detection and neutrinos

- DM and ν rates
- Neutrino Input
- WIMP-I
- WIMP input-II
- Number of ν events
- Mimicking WIMPS
- Constructing the ν floor
- The result
- Sensitivity and new physics

Beyond "standard" WIMPs

Final remarks

The result

Low WIMP mass region $m_\chi \lesssim 10$ GeV:

Challenge: measure $\sigma_{\chi-n} \lesssim 10^{-45} \text{ cm}^2$

High WIMP mass region $m_\chi \gtrsim 10$ GeV:

Challenge: measure $\sigma_{\chi-n} \lesssim 10^{-48} \text{ cm}^2$

**Various experimental techniques can be used to “evade”
the discovery limit saturation point**

What does theory has to say?

Dark matter direct detection and neutrinos

Anatomy of the ν background

- DM and ν rates
- Neutrino Input
- WIMP-I
- WIMP input-II
- Number of ν events
- Mimicking WIMPS
- Constructing the ν floor
- **The result**
- Sensitivity and new physics

Beyond “standard” WIMPs

Final remarks

Sensitivity and new physics

If new physics is present in the neutrino sector the “floor” (sensitivities) will be affected. Sensitivities might improve or get worse!

Beyond “standard” WIMPs

Final remarks

Dark matter direct detection and
neutrinos

Anatomy of the ν background

Beyond “standard” WIMPs

- DD non-relativistic EFT
approach
- Simplified models
- Evading the ν floor

Final remarks

Beyond “standard” WIMPs

DD non-relativistic EFT approach

Adopt a more generic approach for DM direct detection: **Non-relativistic EFT**

$$q \lesssim 100 \text{ MeV} \Rightarrow \Lambda \gtrsim \text{few} \times q$$

$$\mathcal{L}_{\text{Eff}} = \sum_{\mathcal{N}=n,p} \sum_i \mathcal{C}_i^{(\mathcal{N})} \mathcal{O}_i \bar{\chi} \chi \bar{\mathcal{N}} \mathcal{N}$$

$\mathcal{C}_i^{(\mathcal{N})}$ determined by the underlying physics

Operators from Galilean+T+Hermitian vecs: q/m_N , $v^\perp = v + q/\mu_N$, S_N , S_χ

Haxton et. al, 2012

$$\mathcal{O}_1 = 1_\chi 1_N$$

$$\mathcal{O}_6 = \left(\frac{q}{m_N} \cdot S_N\right) \left(\frac{q}{m_N} \cdot S_\chi\right)$$

$$\mathcal{O}_{11} = i \frac{q}{m_N} \cdot S_\chi$$

$$\mathcal{O}_2 = (v^\perp)^2$$

$$\mathcal{O}_7 = S_N \cdot v^\perp$$

$$\mathcal{O}_{12} = S_\chi \cdot (S_N \times v^\perp)$$

$$\mathcal{O}_3 = i S_N \cdot \left(\frac{q}{m_N} \times v^\perp\right)$$

$$\mathcal{O}_8 = S_\chi \cdot v^\perp$$

$$\mathcal{O}_{13} = (S_\chi \cdot v^\perp) \left(\frac{q}{m_N} \cdot S_N\right)$$

$$\mathcal{O}_4 = S_\chi \cdot S_N$$

$$\mathcal{O}_9 = S_\chi \cdot \left(S_N \times \frac{q}{m_N}\right)$$

$$\mathcal{O}_{14} = (S_N \cdot v^\perp) \left(\frac{q}{m_N} \cdot S_\chi\right)$$

$$\mathcal{O}_5 = i S_\chi \cdot \left(\frac{q}{m_N} \times v^\perp\right)$$

$$\mathcal{O}_{10} = i \frac{q}{m_N} \cdot S_N$$

$$\mathcal{O}_{15} = -\left(S_\chi \cdot \frac{q}{m_N}\right) \left((S_N \times v^\perp) \cdot \frac{q}{m_N}\right)$$

In particular models q - or v -dependent operators can be leading

What kind of models??

Dark matter direct detection and neutrinos

Anatomy of the ν background

Beyond "standard" WIMPs

● DD non-relativistic EFT approach

● Simplified models

● Evading the ν floor

Final remarks

Simplified models

UV completions of these operators can be worked out systematically for $s = 0, 1/2, 1$ DM, at least in simplified models

Dent, Krauss et. al, 2015

Simplified model

⇒

Integrate out mediator

$\mathcal{O}_q \sim \bar{q}\Gamma q \rightarrow \mathcal{O}_N \sim \bar{N}\Gamma N$

⇒

Take non-relativistic limit

Fermion DM and scalar mediator

$$\mathcal{L}_{\text{Sim}} = h_2 \bar{\chi} \chi \phi + i \lambda_1 \bar{q} \gamma_5 q + \dots$$

$$\mathcal{L}_{\text{Eff}}^{\text{R}} = \frac{h_{\text{Eff}}}{m_\phi^2} \bar{\chi} \chi \bar{q} \gamma_5 q$$

$\langle N | \bar{q} \gamma_5 q | N \rangle + \text{NR limit} :$

$$\mathcal{L}_{\text{Eff}}^{\text{NR}} \sim i \frac{q}{m_N} \cdot S_N = \mathcal{O}_{10}$$

Direct detection driven by momentum-dependent operator

Evading the ν floor

WIMP interactions with the same Lorentz structure than $\nu - q$ lead to strongly overlapping spectra **otherwise not**

$$\mathcal{L}_{\text{Eff}} \sim \bar{\nu} \gamma_\mu (1 - \gamma_5) \nu \bar{q} \gamma^\mu (g_V^q + g_A^q \gamma_5) q$$

$$\mathcal{L}_{\text{Eff}} \sim \underbrace{\bar{\chi} \gamma_\mu \chi \bar{q} \gamma^\mu q}_{\mathcal{O}_1} \quad \times$$

$$\mathcal{L}_{\text{Eff}} \sim \underbrace{\bar{\chi} \chi \bar{q} \gamma_5 q}_{\mathcal{O}_{10}} \quad \checkmark$$

Dent, Dutta et. al, 2016

For **most operators** ($\chi - q$ interactions) the WIMP signal can be distinguished in experiments with good spectra resolution

All but $\mathcal{O}_{1,4}, \mathcal{O}_{7,8}$
